

## KAITSEPIIRE

- ◆ Kinnita kronsteinid kruvidega puidu külge, jättes sisemise kruvi pingutamata hilisemaks paigaldamiseks.
- ◆ Ühenda puitprofiilid piirdeks 4 nurga abil.
- ◆ Aseta kaitsepiire kerisele nii, et kerise välimine sein lukustuks kronsteini külgmiste painete vahele.
- ◆ Fikseeri piire kruvides kronsteini ja puidu vahel olevad pingutamata kruvid tihedalt kinni.
- ◆ Painuta (soovitavalt näpitsatega) kronsteini alumised otsad tihedalt ümber kerise seina, et fikseerida kronsteinide liikumine. Ongi valmis!
- ◆ Hooldage kaitsepiirde puitosi hingava puidu-kaitsevahendiga, et pikendada nende eluiga. Kasutage ainult sauna jaoks mõeldud tooteid. Korrake hooldusprotseduure vähemalt kord aastas, kuid sageli saunas käies tuleks ka puitu sagedamini töödelda.

## SAFETY RAILING

- ◆ Screw the supports to the wood profiles without tightening the inner screw (for better placement afterward).
- ◆ Create full railing by connecting wood profiles with 4 corner plates.
- ◆ Place the safety railing on the heater in a way that the heater's outer wall locks between the supports' side bends.
- ◆ Fix the untightened screws between the supports and wood profiles.
- ◆ Bend (using pliers) the lower ends of the supports tightly around the heater wall to fix the movement of the supports. Well done!
- ◆ Maintain the wooden parts of the guardrail with a breathable wood preservative to prolong its life. Use only products made for the sauna. Repeat the maintenance procedures at least once a year, but if you use the sauna often, you should also treat the wood more often.
